1332 pages have duplicate meta descriptions

About this issue: Our crawler reports pages that have duplicate meta descriptions only if they are exact matches. A <meta description> tag is a short summary of a webpage's content that helps search engines understand what the page is about and can be shown to users in search results. Duplicate meta descriptions on different pages mean a lost opportunity to use more relevant keywords.

Also, duplicate meta descriptions make it difficult for search engines and users to differentiate between different webpages. It is better to have no meta description at all than to have a duplicate one. How to fix: Provide a unique, relevant meta description for each of your webpages.

For information on how to create effective meta descriptions, please see this Google article: <https://support.google.com/webmasters/answer/35624>.

1332 ⁰

1322 issues with duplicate title tags

About this issue: Our crawler reports pages that have duplicate title tags only if they are exact matches. Duplicate <title> tags make it difficult for search engines to determine which of a website's pages is relevant for a specific search query, and which one should be prioritized in search results. Pages with duplicate titles have a lower chance of ranking well and are at risk of being banned.

Moreover, identical <title> tags confuse users as to which webpage they should follow. How to fix: Provide a unique and concise title for each of your pages that contains your most important keywords. For information on how to create effective titles, please see this Google article: <https://support.google.com/webmasters/answer/35624>.

1322 ⁰

1316 pages have duplicate content issues

1316 0

About this issue: Webpages are considered duplicates if their content is 85% identical. Having duplicate content may significantly affect your SEO performance. First of all, Google will typically show only one duplicate page, filtering other instances out of its index and search results, and this page may not be the one you want to rank.

In some cases, search engines may consider duplicate pages as an attempt to manipulate search engine rankings and, as a result, your website may be downgraded or even banned from search results. Moreover, duplicate pages may dilute your link profile. How to fix.

Here are a few ways to fix duplicate content issues: 1. Add a rel="canonical" link to one of your duplicate pages to inform search engines which page to show in search results. 2.

Use a 301 redirect from a duplicate page to the original one. 3. Use a rel="next" and a rel="prev" link attribute to fix pagination duplicates.

4. Instruct GoogleBot to handle URL parameters differently using Google Search Console. 5.

Provide some unique content on the webpage. For more information, please read these articles:

<https://support.google.com/webmasters/answer/66359?hl=en> and

<https://support.google.com/webmasters/answer/139066?hl=en>.

267 pages have slow load speed

267 0

About this issue: Page (HTML) load speed is one of the most important ranking factors. The quicker your page loads, the higher the rankings it can receive. Moreover, fast-loading pages positively affect user experience and may increase your conversion rates.

Please note that "page load speed" usually refers to the amount of time it takes for a webpage to be fully rendered by a browser. However, crawler only measures the time it takes to load a webpage's HTML code - load times for images, JavaScript and CSS are not factored in. How to fix: The main factors that negatively affect your HTML page generation time are your server's performance and the density of your webpage's HTML code.

So, try to clean up your webpage's HTML code. If the problem is with your web server, you should think about moving to a better hosting service with more resources.

224 pages couldn't be crawled

224 0

28 internal images are broken

28 0

About this issue: An internal broken image is an image that can't be displayed because it no longer exists, its URL is misspelled, or because the file path is not valid. Broken images may jeopardize your search rankings because they provide a poor user experience and signal to search engines that your page is low quality. How to fix: To fix a broken internal image, perform one of the following: 1.

If an image is no longer located in the same location, change its URL. 2. If an image was deleted or damaged, replace it with a new one.

3. If an image is no longer needed, simply remove it from your page's code.

12 pages returned 4XX status code

12⁰

About this issue: A 4xx error means that a webpage cannot be accessed. This is usually the result of broken links. These errors prevent users and search engine robots from accessing your webpages, and can negatively affect both user experience and search engine crawlability.

This will in turn lead to a drop in traffic driven to your website. Please be aware that crawler may detect a working link as broken if your website blocks our crawler from accessing it. This usually happens due to the following reasons: 1.

DDoS protection system. 2. Overloaded or misconfigured server.

How to fix: If a webpage returns an error, remove all links leading to the error page or replace it with another resource. To identify all pages on your website that contain links to a 4xx page, click "View broken links" next to the error page. If the links reported as 4xx do work when accessed with a browser, you can try either of the following: 1.

Contact your web hosting support team. 2. Instruct search engine robots not to crawl your website too frequently by specifying the "crawl-delay" directive in your robots.txt.

12 internal links are broken

12⁰

About this issue: Broken internal links lead users from one website to another and bring them to non-existent webpages. Multiple broken links negatively affect user experience and may worsen your search engine rankings because crawlers may think that your website is poorly maintained or coded. Please note that our crawler may detect a working link as broken.

Generally, this happens if the server hosting the website you're referring to blocks our crawler from accessing this website. How to fix: Please follow all links reported as broken. If a target webpage returns an error, remove the link leading to the error page or replace it with another resource.

If the links reported as broken do work when accessed with a browser, you should contact the website's owner and inform them about the issue.

9 pages don't have title tags

9⁰

About this issue: A <title> tag is a key on-page SEO element. It appears in browsers and search results, and helps both search engines and users understand what your page is about. If a page is missing a title, or a <title> tag is empty, Google may consider it low quality.

In case you promote this page in search results, you will miss chances to rank high and gain a higher click-through rate. How to fix: Ensure that every page on your website has a unique and concise title containing your most important keywords. For information on how to create effective titles, please see this Google article:

<https://support.google.com/webmasters/answer/35624>.

This page has no viewport tag

9⁰

About this issue: The viewport meta tag is an HTML tag that allows you to control a page's viewport size and scale on mobile devices. This tag is indispensable if you want to make your website accessible and optimized for mobile devices. For more information about the viewport meta tag, please see the Responsive Web Design Basics article:

<https://developers.google.com/web/fundamentals/design-and-ux/responsive/>.

How to fix: Set the viewport meta tag for each page, and then test your website on a mobile device to make sure everything works fine.

2 pages couldn't be crawled (DNS resolution issues)

2⁰

No redirect or canonical to HTTPS homepage from HTTP version

1 0

About this issue: If you're running both HTTP and HTTPS versions of your homepage, it is very important to make sure that their coexistence doesn't impede your SEO. Search engines are not able to figure out which page to index and which one to prioritize in search results. As a result, you may experience a lot of problems, including pages competing with each other, traffic loss and poor placement in search results.

To avoid these issues, you must instruct search engines to only index the HTTPS version. How to fix: Do either of the following: 1. Redirect your HTTP page to the HTTPS version via a 301 redirect.

2. Mark up your HTTPS version as the preferred one by adding a rel="canonical" to your HTTP pages.

6950 issues with unminified JavaScript and CSS files

6950 ⁰

About this issue: Minification is the process of removing unnecessary lines, white space and comments from the source code. Minifying JavaScript and CSS files makes their size smaller, thereby decreasing your page load time, providing a better user experience and improving your search engine rankings. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Minify your JavaScript and CSS files. If your webpage uses CSS and JS files that are hosted on an external site, contact the website owner and ask them to minify their files. If this issue doesn't affect your page load time, simply ignore it.

5776 images don't have alt attributes

5776 ⁰

About this issue: Alt attributes within `` tags are used by search engines to understand the contents of your images. If you neglect alt attributes, you may miss the chance to get a better placement in search results because alt attributes allow you to rank in image search results. Not using alt attributes also negatively affects the experience of visually impaired users and those who have disabled images in their browsers.

For more information, please see these articles: Using ALT attributes smartly:

<https://webmasters.googleblog.com/2007/12/using-alt-attributes-smartly.html> and Google Image Publishing Guidelines: <https://support.google.com/webmasters/answer/114016?hl=en>.

How to fix: Specify a relevant alternative attribute inside an `` tag for each image on your website, e.g., ``.

4451 issues with uncompressed JavaScript and CSS files

4451 ⁰

About this issue: This issue is triggered if compression is not enabled in the HTTP response. Compressing JavaScript and CSS files significantly reduces their size as well as the overall size of your webpage, thus improving your page load time. Uncompressed JavaScript and CSS files make your page load slower, which negatively affects user experience and may worsen your search engine rankings.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, you should make sure they do not affect your page's load time. For more information, please see this Google article <https://developers.google.com/web/fundamentals/performance/optimizing-content-efficiency>. How to fix: Enable compression for your JavaScript and CSS files on your server.

If your webpage uses uncompressed CSS and JS files that are hosted on an external site, contact the website owner and ask them to enable compression on their server. If this issue doesn't affect your page load time, simply ignore it.

1341 pages don't have doctype declared

1341 ⁰

About this issue: A webpage's doctype instructs web browsers which version of HTML or XHTML is being used. Declaring a doctype is extremely important in order for a page's content to load properly. If no doctype is specified, this may lead to various problems, such as messed up page content or slow page load speed, and, as a result, negatively affect user experience.

How to fix: Specify a doctype for each of your pages by adding a `<!Doctype>` element (e.g., `<!Doctype HTML5>`) to the very top of every webpage source, right before the `<html>` tag.

1341 uncompressed pages

1341 ⁰

About this issue: This issue is triggered if the Content-Encoding entity is not present in the response header. Page compression is essential to the process of optimizing your website. Using uncompressed pages leads to a slower page load time, resulting in a poor user experience and a lower search engine ranking.

How to fix: Enable compression on your webpages for faster load time.

**1135 pages have low text-HTML ratio****1135** 0

About this issue: Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content.

That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster.

How to fix: Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.

956 HTTP URLs in sitemap.xml for HTTPS site**956** 0**395 pages have too many parameters in their URLs****395** 0**196 pages have too much text within the title tags****196** 0

About this issue: Most search engines truncate titles containing more than 70 characters. Incomplete and shortened titles look unappealing to users and won't entice them to click on your page. For more information, please see this Google article:

<https://support.google.com/webmasters/answer/35624>.

How to fix: Try to rewrite your page titles to be 70 characters or less.

65 URLs with a temporary redirect**65** 0

About this issue: Temporary redirects (i.e., a 302 and a 307 redirect) mean that a page has been temporarily moved to a new location. Search engines will continue to index the redirected page, and no link juice or traffic is passed to the new page, which is why temporary redirects can damage your search rankings if used by mistake. How to fix: Review all URLs to make sure the use of 302 and 307 redirects is justified.

If so, don't forget to remove them when they are no longer needed. However, if you permanently move any page, replace a 302/307 redirect with a 301/308 one.

53 pages don't have an h1 heading**53** 0

About this issue: While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly.

How to fix: Provide a concise, relevant h1 heading for each of your page.

25 pages have a low word count**25** 0

About this issue: This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts.

For more information, please view this video: <https://www.youtube.com/watch?v=w3-obcXkyA4>.

How to fix: Improve your on-page content and be sure to include more than 200 meaningful words.

24 links on HTTPS pages leads to HTTP page**24** 0

22 pages have underscores in the URL

22 ⁰

About this issue: When it comes to URL structure, using underscores as word separators is not recommended because search engines may not interpret them correctly and may consider them to be a part of a word. Using hyphens instead of underscores makes it easier for search engines to understand what your page is about. Although using underscores doesn't have a huge impact on webpage visibility, it decreases your page's chances of appearing in search results, as opposed to when hyphens are used.

For more information, please see this Google article:

<https://support.google.com/webmasters/answer/76329?hl=en>. How to fix: Replace underscores with hyphens. However, if your page ranks well, we do not recommend that you do this.

9 pages don't have meta descriptions

9 ⁰

About this issue: Though meta descriptions don't have a direct influence on rankings, they are used by search engines to display your page's description in search results. A good description helps users know what your page is about and encourages them to click on it. If your page's meta description tag is missing, search engines will usually display its first sentence, which may be irrelevant and unappealing to users.

For more information, please see these article: Create good titles and snippets in Search Results:

<https://support.google.com/webmasters/answer/35624>. How to fix: In order to gain a higher click-through rate, you should ensure that all of your webpages have meta descriptions that contain relevant keywords.

9 pages have no hreflang and lang attributes

9 ⁰

About this issue: This issue is reported if your page has neither lang nor hreflang attribute. When running a multilingual website, you should make sure that you're doing it correctly. First, you should use a hreflang attribute to indicate to Google which pages should be shown to visitors based on their location.

That way, you can rest assured that your users will always land on the correct language version of your website. You should also declare a language for your webpage's content (i.e., lang attribute). Otherwise, your web text might not be recognized by search engines.

It also may not appear in search results, or may be displayed incorrectly. How to fix: Perform the following: 1. Add a lang attribute to the <html> tag, e.g., "<html lang='en'>".

2. Add a hreflang attribute to your page's <head> tag, e.g., <link rel='alternate' href='http://example.com/' hreflang='en'/>.

Sitemap.xml not indicated in robots.txt

1 ⁰

About this issue: If you have both a sitemap.xml and a robots.txt file on your website, it is a good practice to place a link to your sitemap.xml in your robots.txt, which will allow search engines to better understand what content they should crawl. How to fix: Specify the location of your sitemap.xml in your robots.txt. To check if Googlebot can index your sitemap.xml file, use the Sitemaps report in Google Search Console: https://search.google.com/search-console/not-verified?original_url=/search-console/sitemaps&original_resource_id.
